

AT6102, A6102A, AT6102B Spectrometers

Radionuclide Identification Device

Portable multifunctional radiation monitoring devices, primarily designed for search and detection of gamma radiation sources with automatic identification of radionuclide composition.

Can be used for area and land radiation monitoring with data GPS-referencing.

AT6102 model can detect neutron radiation and measure neutron count rate.

Application

- Unauthorized traffic control of radioactive sources and materials
- Radioactive waste control, recycling and disposal
- Radiation monitoring of ecological environment, areas and facilities
- Nuclear and radiation accidents management, radiation monitoring during decontamination operations
- Nuclear industry and Nuclear power plants
- Radiopharmaceuticals production and Nuclear medicine
- Geological survey
- Research activities

Features

- Detection of gamma, neutron, alpha and beta radiation
- Real-time spectra analysis and radionuclide identification
- Multiple functions
- Single-block design
- One-hand operation
- Automatic accommodation to change of radiation background level
- On-line and expert mode operation
- Automatic logging of scan data with GPS-referencing for further analysis
- Digital automatic LED stabilization and temperature compensation system
- Sound, visual and vibration notification
- Recording and storing measurement result and spectra in memory
- Field operation in a wide temperature range
- Instrument-to-PC data exchange over USB or Bluetooth interface
- External detection units can be connected

Application software

- «SpectEx» Real time display of data measured by instrument with further ability to process and save it into PC, as well as instrument file system management
- «GARM» Processing and analysis of stored data with display on a base map

Operating principle

The spectrometer operates in continuous radiation environment scan mode: search, detection, localization and identification of gamma sources; detection of neutron radiation.

When radioactive source is detected the spectrometer activates alarm and identifies its radionuclide composition.

High-sensitivity scintillation NaI(Tl) gamma radiation detector is used in these devices. The spectrometer is equipped with Geiger-Muller counter with filter, which aligns energy dependence of appliance sensitivity to extend dose rate measurement range.

Two integrated proportional helium counters of slow neutrons in polyethylene moderator are used in AT6102 model.

Storage and transportation bag for spectrometer and accessories

The possibility of external detection unit connection allows measurement of alpha and beta particles flux density from contaminated surfaces (BDPA-01/BDPB-01) and neutron radiation dose rate (BDKN-03).
